

Lab 2

Starting with the code in `~lliang/cs260/labs/lab2` write code to manage a linked list using iterative approach.

You can build the app using the `make` command, which is supported by the file named `makefile` that's provided in the directory.

For lab2 submission, copy the member function `bool LinkedList::del(char)` implementation into `lab2.txt`, then append the output of the app to the file. ftp `lab2.txt` to your local machine and upload it to the Desire2Learn dropbox.

```
./app >> lab2.txt
```
